Laile

Home physio that counts every rep and checks in.

Tencent Cloud AI CAN DO IT Hackathon Singapore 2026
Healthcare track • Challenge Statement 2

Charles Andrew Lim

Physio happens at home, where nobody sees it

50%

of people in rehab may not do their home exercise [1]

21.4%

of Singapore citizens are 65 or older (2026), a super-aged society [3]

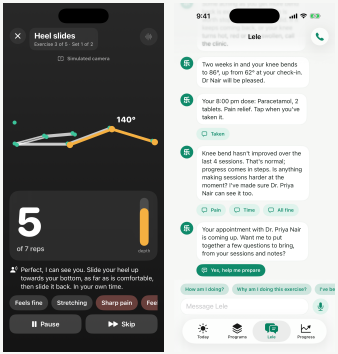

Why people stop (systematic review of 20 studies [2]): low confidence, low mood, worry, pain during exercise, no support, too many barriers.

What a physio sees between visits: nothing. A checkbox can't tell a done exercise from a skipped one, or one stopped because it hurt.

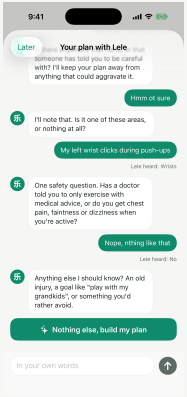

What the brief asks for: support that is empowering, personalised, longitudinal, safe, strictly bounded and honest about uncertainty.

Laile in one breath

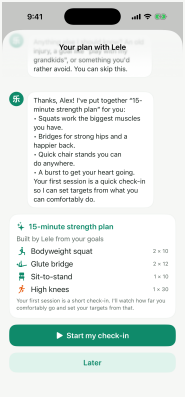

- **Programs are the unit.** A physio's program (joined with their code), a plan Lele builds from your goals, or a calisthenics program.
- **The camera counts.** Reps, holds, knee bend and arm lift, measured on the phone. Video stays there.
- **Lele checks in.** A coach that talks you through sessions, asks how you are each morning, reminds, notices, remembers what hurt.
- **The physio stays on top.** Live sessions, a daily list, approvals, signatures, discharge.
- **Code decides, the model talks.** Safety and every number come from tested rules.

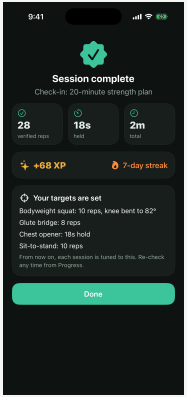

Start: tell Lele your goals, or bring a physio's code

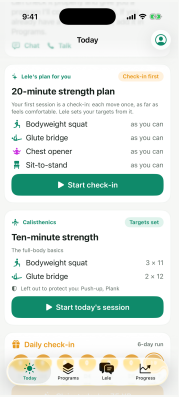

Goals in your own words; options are suggestions

Lele's plan leaves out what your wrists can't take

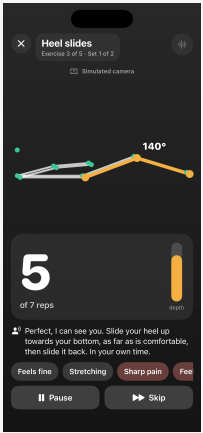

First session is a check-in that sets targets

Limits follow you into every program

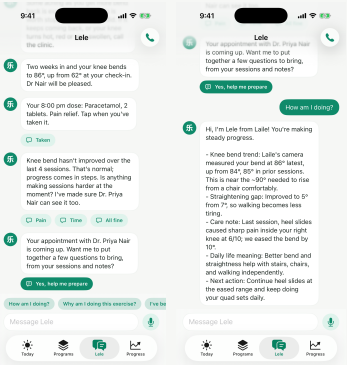

Sessions: the camera counts, Lele coaches

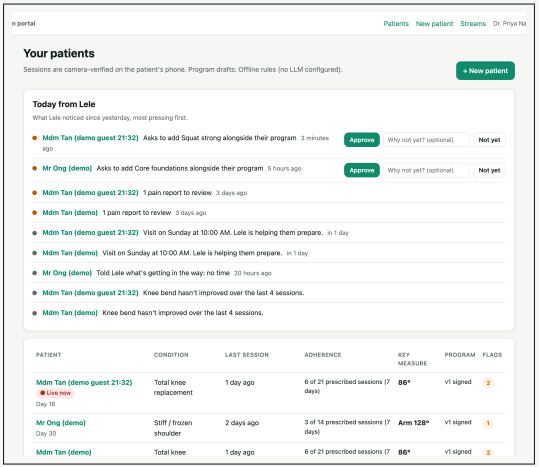

- Apple Vision tracks joints on the phone; a rep counts only at the target angle, a hold only while in position.
- Lele takes turns like a conversation: explains, says *"In your own time"*, counts, asks *"How did that feel?"* between sets.
- Say "it's pulling" or "sharp pain" any time. Fixed rules decide: carry on, stop the set, stop, or get help.
- Something sore? Lele notes it and makes that exercise easier next time, then eases back after two comfortable sessions.
- Can't see you? No count: *"I can't see you clearly, so I'm not counting that."*

Lele takes initiative, and you can talk back

- **Morning check-in** in physio. “Quite swollen this morning” makes today’s session gentler and tells the physio.
- **Medicine reminders** at the doctor’s times, as notifications too; “What’s this for?” on every dose.
- **Missed days:** one nudge, then “what’s getting in the way?”
- **Plateaus and visit prep** from real measurements.
- **Chat or call** Lele, built on Tencent Cloud ADP with a curated knowledge base.
- **Never nags:** quiet 9 pm to 7 am, three conversations a day at most.

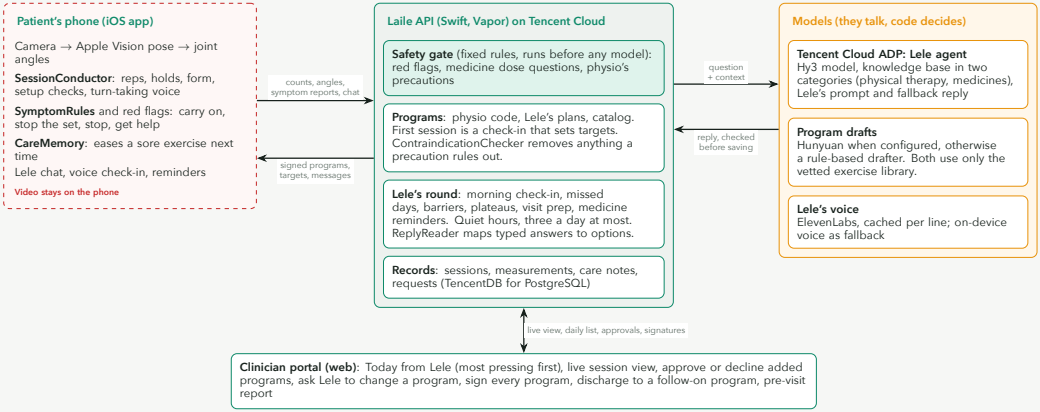

The physio stays on top

- **Today from Lele**, most pressing first: red flags, worse this morning, pain reports, requests, missed days.
- **Live view** of a session: exercise, reps, measured angle.
- **Approve** extra programs; **ask Lele** to change one in plain words; **sign** every version.
- **Discharge** hands the patient to a follow-on program, limits kept.

Architecture and trust boundary

How the AI is used, and kept safe

Job	Done by	Kept safe by
Conversation and explanations	Lele on **Tencent Cloud ADP** (Hy3, 12-document knowledge base)	Real context sent with each message; red flags and dose questions answered by rules first
Remembering what hurt	Care notes	Easing computed by code; physio sees every note
Program drafts	Hunyuan or rule-based drafter	Vetted library only, precautions enforced, physio signs
Understanding replies	Keyword rules	"Lele heard: …"; asks again if unclear
Seeing movement	Apple Vision on device	Video stays on the phone

- Dose questions: fixed referral to the doctor or pharmacist. Unknown medicine: *"I'm not able to identify that medication, please check with your pharmacist."*
- 121 automated tests cover counting, safety rules, care notes, Lele's round and the server flows.

Fit with Challenge 2

Medication understanding	“What’s this for?” on every dose, from the medicines knowledge base
Medication management	Reminders at the doctor’s times; one tap or a typed reply marks a dose taken
Adherence support	Camera-verified sessions, check-in targets, forgiving streaks, barrier questions
Health tracking	Knee bend, straightening gap, arm lift, reps, holds and pain against baseline
Preventive health	Precautions follow you; plateau and missed-day flags; follow-on programs
Healthcare preparation	Visit prep questions; pre-visit report for the physio
Safe, bounded, honest	Rule-based red flags and referrals; no count without a clear view

Why it can last

Clinics
Verified adherence, live sessions and a prioritised daily list without extra visits. Proposed: a monthly fee per active patient.

People
Discharge leads to a calisthenics or mobility program with limits carried over. Consumer subscription for people without a physio.

A loop
Everyday users with aches are pointed to a physio; physio patients become everyday users afterwards.

Cheap to run
Pose estimation on the phone; model calls only for conversation; voice lines cached and paid for once.

Where it stands

Working now

- iOS app: Today, Programs, Lele, Progress
- Camera pipeline (Simulator, simulated skeleton)
- Server and clinician portal
- Lele published on Tencent Cloud ADP
- Demo accounts with realistic history
- 121 automated tests

Next

- Tencent Cloud Lighthouse and TencentDB
- Real-iPhone testing; TestFlight
- Knowledge base review by a physiotherapist and a pharmacist
- Pilot with one clinic
